Future agendas in urban tourism research: Special Editorial

Tina Šegota, Marianna Sigala, Ulrike Gretzel, Jonathon Day, Jithendran Kokkranikal, Melanie Smith, Joan C. Henderson, Claudia Seabra, Philip Pearce, Rob Davidson, Cina Van Zyl, David Newsome, James Hardcastle, Tijana Rakić

Foreword

Dr Tina Šegota (University of Greenwich), IJTC Theme Editor of Quality for Life in Tourism Cities

Academic researchers were provided with an additional forum to exchange knowledge, research and agendas on the critical study of urban tourism and tourism cities with the emergence of the *International Journal of Tourism Cities* in 2015. Since then, the Journal has been recognized for its outstanding contribution to urban tourism research by numerous scholars. This recognition was embodied in prestigious academic abstracting and indexing, such as achieving the Emerging Sources Citation Index, and Scopus and SJR indices of above 0.5.

International Journal of Tourism Cities also welcomed numerous international scholars to its editorial board, of which some also serve as the theme editors. Theme editors were invited to provide their insights on future research agendas in urban tourism research. With this gesture, the Journal wishes to mark the celebration of the fifth volume in the fifth year of publishing and many abovementioned recognitions, as well as acknowledging the valuable time and effort of many scholars dedicated to its recent success.

Therefore, this Special Editorial serves as a roadmap for future research on the opportunities and challenges for urban tourism. It initially touches upon more recent technological advancements and their impact on tourism in cities, calling for a better understanding of the concept of smartness and highlighting the importance of social media. Furthermore, sustainability, quality of life, and tourism planning and development have been heavily challenged by sharing economy and tourists' quest for unique experiences enabled by new technologies. Several important questions and perspectives have been outlined – from responsible tourism to ethnoscaping, to acknowledgement that urban tourism not only impacts the quality of life of local residents but also its visitors. Lessons learnt from crises may bring new opportunities for managing urban tourism, just as in the case of Post-Communist countries. However, with the issue of terrorism at every corner of the world, new research on crisis management is anticipated. Looking further down the line of challenges for urban tourism, tourists' behaviour has dynamically changed with the help of new technologies. So, has the behaviour of business travellers, for whom we need a better understanding of their experiences of being invited, to attend, to post-travel behaviour in relation to business events. Moreover, there is a need for a better understanding of special interest tourism and its impact on tourism management, supply and demand business perspectives, and host community. Similarly, new research agendas should also focus on the conservation of nature and its importance for city

1
2
3 tourism. In conclusion, the Special Editorial brings a fresh perspective on new visual research
4 methodology that offers numerous possibilities for research by elicitation of techniques and
5 researcher- or research participant-produced visuals.

9 **eTourism and on how to address the smart city complexity**

10
11 *by Professor Marianna Sigala (University of South Australia), IJTC Theme Editor for eTourism*
12

13
14 There is no dispute that city tourism will continue to grow. Many tourism cities are also threatening
15 to become from currently big to megacities faced with problems of the overloaded and insufficient
16 carrying capacity of resources and infrastructure. Livability, sustainability, quality of life and
17 (psychological, physical, socio-cultural and mental) well-being of tourists but also residents,
18 security and safety, avoidance of commercialization/Disneyfication of cultural resources and
19 spaces are only some of the top issues that many tourism cities already need to address. Nowadays,
20 to achieve that, one does not have to work harder but smarter. Indeed, everything becomes smarter:
21 smart citizens, smart tourists, smart destinations, smart tourism attractions, smart cars, smart
22 houses, ... smart everything. In China alone, the government's priority is to have 40 smart cities
23 by 2020. It seems that the socio-technological factors that have contributed to the increase of
24 tourism flows and inhabitants into cities can be used and are currently used to turn the issues
25 around. One might call this strategy against overtourism and over-population 'fight them with their
26 own weapons'.
27
28

29
30 Technological advances and their implications [social media, IoT, sharing economy/peer-to-peer
31 platforms, e.g. Uber, Airbnb, the EasyJet /low-cost phenomenon in all sectors such as air carriers,
32 accommodation), the increased people's mobilities (i.e. digital nomads) are indeed responsible for
33 the 'Instagram' popularity and the overflow of tourists in numerous cities like Barcelona,
34 Amsterdam], even in remote places like Hobart (Tasmania) whereby locals are displaced and/or
35 complain about lack of housing, over-priced accommodation, conversion of residential areas into
36 tourism hotspots. Simultaneously, many cities all over the globe have also been receiving more and
37 more domestic and overseas immigrants and refugees, as a result, overseas political instability or
38 the sought of domestic rural people seeking a better modern city life.
39
40

41
42 But at the same time, technological advances are being used and developed to make (tourism) cities
43 more livable and sustainable: smart energy solutions manage waste and resources like water and
44 electricity; big data (from Uber, social media etc.) inform urban planners on how to optimize public
45 transportation systems and destination marketers to divert tourists off route and to less
46 'Instagrammed' popular hot spots; smart governance empowers citizens and tourists to raise their
47 voice and participate in decision-making about their city lives and experiences; peer-to-peer
48 platforms democratize access to the 'capitalist' economy and enable homelessly, disadvantaged
49 groups, refugees to become micro-entrepreneurs (e.g. micro-restaurants, micro-tourist guides) in
50 order to raise income, promote their 'own culture', avoid being ghettoized and so, become
51 integrated within, be appreciated and understood by the local city communities; drones, artificial
52 intelligence, robotics and teleporting will reduce transportation needs and problems (such as
53 pollution and security) through urban delivery, monitoring, data collection. But then, all these new
54 technologies raise new issues and dilemmas such as: digital 'discrimination' (why black Uber
55
56
57
58
59
60

1
2
3 drivers and Airbnb hosts are less selected and lower paid?); privacy, ownership and security of big
4 data; ethical and legal issues of drones and driverless cars 'programmed' to kill pedestrians over
5 the passengers (who can decide about the value of the life of each individual, what the law says
6 about the responsibility of programmers and machine learning devices, and what are the ethical
7 issues of placing a value next to various people's lives?).
8
9

10 Overall, it seems that in this smart tourism cities world things become more complex and perplex
11 to understand and manage. We are required to update and redefine legislation, cultural value
12 systems, ethical values and lifestyles (what do we mean by micro-entrepreneur or digital nomad)
13 now, but without currently knowing what the applications and implications of all these new socio-
14 technological changes and innovations are and could be.

19 **Social media and the City: Mediated gazes and digital traces**

20
21 *by Professor Ulrike Gretzel (University of Southern California), IJTC Theme Editor for Social*
22 *Media in City Tourism Marketing*
23

24 Månsson (2011) argues that tourism spaces are becoming increasingly mediatized, with ordinary
25 travellers and residents contributing to this phenomenon by sharing their experiences through an
26 ever-growing array of social media applications. Jansson (2007) draws attention to the "close
27 relationship between spatial and communicative practice" (p. 10) in the context of tourism and
28 suggests that new media produce a different kind of space and a different kind of tourism by
29 affecting the way tourists script, navigate and represent their tourism experiences. This is
30 particularly the case for cities because the communicative density and heightened levels of
31 connectivity in urban spaces facilitate social media use in critical ways (Magasic and Gretzel,
32 2017).
33
34
35

36 Social media play several important roles in tourism (Gretzel, 2018), and specifically in urban
37 tourism. Social media use fuels our desire to travel because it creates vacation envy through
38 exposure to others' enticing social media posts. Social media technologies are also incredibly
39 'needy' and persuade us to constantly post to please our social media audiences (Kozinets *et al*,
40 2016). They demand that we post extraordinary, share-worthy contents and tourist gazes are
41 increasingly fixated on finding such experiences at tourist destinations (Dinhopl and Gretzel,
42 2016). Cities with their many walls, buildings, signs, art displays, public spaces, hidden alleyways,
43 stairs, bridges, lights, shops, cafés, libraries, etc. offer an unlimited supply of objects and
44 landscapes that can be framed in interesting ways for social media sharing.
45
46
47

48 Social media further inspire us to experience cities beyond the core tourism attractions by exposing
49 us to curated lists of places that are instagrammable or 'trendy with the locals'. Based on the
50 expanding universe of reviews, we can immediately judge whether these locales meet our
51 preferences and unique needs. And we do no longer have to experience these places alone as social
52 media afford new levels of social connectivity (Munar *et al*, 2013). Our urban adventures can be
53 instantaneously shared via snaps or live videos with friends and family staying at the hotel or at
54 home, with broader social media audiences or with tourism providers. At the same time, social
55
56
57
58
59
60

1
2
3 media allow us to connect with other tourists or with locals by showing us who is near and
4 interested/interesting. Cities, more so than any other destination type, deliver the necessary social
5 density and diversity to foster such connections. Moreover, social media allow us to connect with
6 our future cosmopolitan selves who can relive our city trips when social media ‘memories’ pop up
7 on our screens.
8
9

10 Importantly, social media also provide us with new means to study these urban tourism
11 experiences. They supply large quantities of geo-located digital traces of city tourists that can be
12 quantitatively analysed to understand how urban spaces are navigated (Stienmetz, 2018). At the
13 same time, they provide extremely rich experiential accounts of city tourism in a textual or visual
14 form that can be scrutinized using netnographic techniques (Woodside *et al*, 2007). Seeing city
15 tourism at this nexus of geographic and communicative practice, as suggested by Jansson (2007),
16 therefore opens up many avenues to understanding tourism in urban environments that have yet to
17 be explored by tourism researchers.

23 **The diversity of approaches to sustainability in tourism cities: initiating new research on** 24 **dynamic and adaptive responses**

25 *by Dr Jonathon Day (Purdue University), IJTC Theme Editor for Sustainable Tourism*
26

27 While much of the conversation about sustainable tourism to date seems to focus on small-scale
28 rural locations, the big story in the years to come is sustainable tourism in cities. In 2000, at the
29 dawn of the new century, the Mohonk Agreement recognized that sustainable tourism was a set of
30 principles that can be applied to all tourism operations – rural and urban. In the intervening years,
31 the growth of cities and the continuing trends for urbanization have ensured that greater attention
32 must be placed on the sustainability of urban tourism. Fortunately, the trend has begun, and greater
33 attention is being paid to sustainability in urban destinations (Lu and Nepal, 2009). Nevertheless,
34 as we move into 2020, the opportunity – and need for – research on sustainability in tourism cities
35 is great.
36
37
38

39 The challenges of understanding sustainable tourism in cities are significant. Tourism is a complex,
40 adaptive system (Farrell and Twining-Ward, 2005; Morrison *et al*, 2018), and this is never more
41 evident than in urban tourism. In each city, a wide range of companies contribute to the provision
42 of tourism services. In addition, tourism is dependent on services provided by organizations that
43 do not even consider themselves part of the tourism system. Utilities providing energy, water, waste
44 disposal, and transportation services all serving the community and tourists and each organization
45 impacting the sustainability of the tourism in cities. Even at the individual level, the behaviour of
46 each traveller visiting the city has the potential to either contribute positively or negatively to the
47 city during their visit. Research on sustainable tourism in cities must be conducted examining the
48 city as a system, as well as the contributions of organizations within the system and individual
49 behaviour.
50
51
52

53 Tourism researchers must also recognize the tourism system is dynamic and adaptive (Day, 2016).
54 Tourism organizations are both initiating changes and responding to them. In 2008, few could
55
56
57
58
59
60

1
2
3 predict the impacts of Airbnb on tourism in cities. Today, cities continue to grapple with changes
4 in disruptive technology. New forms of transportation are changing the streets and sidewalks of
5 tourism cities. From the need to provide charging for electric vehicles, to new policies responding
6 to the rapid rise of shared bikes and electric scooters, urban centres that host tourism must respond
7 to the changing landscape. The opportunity to generate a greater understanding of these processes
8 through longitudinal studies is great.
9
10

11 The scope of enquiry is great. Not only must we gain a greater understanding of what must be done,
12 but how it will be done. The diversity of approaches to sustainability is exciting and offers a great
13 opportunity for research. Cities are proving to be the laboratories for new policies and practices,
14 often leading the way in new practices that tourism organizations must adopt. Smart tourism is
15 improving the information available on which to build sustainability plans. Still there is work to be
16 done in understanding what works most effectively. And while much sustainability research has
17 addressed what must be done to achieve greater sustainability in cities, less has been done on how
18 we achieve these goals. Sustainability requires collaboration and cooperation between a variety of
19 actors within the destination system, and it requires tourists and suppliers working together to
20 achieve these goals.
21
22
23

24 Tourism researchers are making progress on many of these issues. As we address the challenges in
25 our complex, ever-changing cities, we must be ready to embrace new perspectives and approaches.
26 The challenge of sustainability in tourism cities encourages a multidisciplinary approach.
27 Disciplines as varied as environmental engineering and sociology, consumer behaviour and town
28 planning, hydrology and marketing, to name just a few, must all contribute to our growing
29 understanding of the issues associated with urban sustainability and tourism.
30
31

32 The stakes have never been higher. While tourism has the potential to contribute to the achievement
33 of sustainability goals, it may also contribute to many of the challenges facing the world.
34 Environmental issues, economic development and social justice issues are evident across the
35 tourism system – in cities that play host to many of the world's tourists. Indeed, beyond the general
36 issues of sustainability in tourism, tourism cities are addressing new challenges including visitor
37 management and overtourism.

42 **For residents or for tourists? The quality of life nexus in tourism cities**

43
44 *by Dr Tina Šegota (University of Greenwich), IJTC Theme Editor of Quality for Life in Tourism*
45 *Cities*
46
47

48 In the light of recent residents' protests in Barcelona, Mallorca and Venice, to name a few, it is fair
49 to conclude that the quality of life in tourism cities has been heavily challenged by increasing
50 numbers of visitors and accompanying perceived negative impacts of tourism. Hence, the new
51 buzzwords 'overtourism', 'overcrowding', 'anti-tourism' and 'tourism-phobia' were introduced
52 across academic journals and other newspapers, igniting a new debate that may have rather existed
53 for almost half of century. This is because the reasons for residents' mobilization against tourism
54 and governments' actions to mitigate its negative impacts are not fully understood by the literature.

Regardless of the resident attitudes towards tourism being one of the most extensively researched fields, dating back over more than 50 years, it failed to predict a tipping point for such extreme events. Note that many criticize the research filed as being unilateral and quantitative (in its own right), and that as such it failed to appreciate that perceived impacts or reactions to tourism are not singular or absolute (Deery *et al*, 2012; Nunkoo *et al*, 2013; Sharpley 2014; García *et al*, 2015; McKercher *et al*, 2015; Šegota *et al*, 2017).

32
Quality of life in tourism cities has been further challenged by the mediated gaze supported by social media and tourists' constant search for new, exciting and authentic experiences. In the constant battle for the economic development and growth originating from tourist visitations, some cities even went great lengths to attract visitors by immersing their identity to the identity liked by (potential) visitors. One such example is the city of Dubrovnik, a UNESCO Heritage Site since 1979, which has become a fantasyland for the Game of Thrones fans (Šegota, 2018a). The change of the city's identity has been greatly encouraged by the work of Croatian DMO in promoting the city as King's Landing on social media, which Šegota (2018b) describes as unintentional practices gone 'great'. However, the real issue is whether Dubrovnik or any other filming destination can continue to sustain itself as a significant heritage destination. Since 'new Dubrovnik' has been increasingly profiled and promoted as King's Landing, the city is now at risk of acquiring the image of a destination for film enthusiasts that only lasts a decade. That will, undeniably, result in fewer visitations over years to come as the outcome of decreased popularity of the film. However, it is not known and well-worth exploring, to what extent will the economic benefits from popular tourism decrease, leaving local residents with, on one hand, constant struggle for improving the sense of material well-being, and, on the other hand, challenges of city's identity with the effect to the sense of community well-being.

47
48
Importantly, the quality of life in tourism cities does not only apply to local residents but also to tourists that spend a considerable amount of time in cities. Thus, the quality of life has to be examined not only from the aspect of residents' well-being but also from tourists' well-being (Uysal *et al*, 2012). It was noted that a fully functioning tourism system should be a prerequisite for understanding and identifying both tangible and intangible benefits and costs of tourism (Uysal *et al*, 2012). Seeing urban tourism as an enabler of attaining a set of desired quality of life goals for residents and tourists whilst maintaining sustainable tourism system at a competitive edge, will open many new opportunities for research on allocating limited resources and developing appropriate tourism development and destination marketing strategies.

69
70
Cities are no longer seen as mere ports of entry or transit points but have emerged as substantial tourist destinations that offer a wide range of tourist attractions and activities (Postma *et al*, 2018). Tourists visit cities for a variety of reasons, ranging from leisure to business and are a source of significant economic benefits. While being a source of dynamism and vitality, tourism has fast

1
2
3 been becoming another source of pressure on the economy, infrastructure, society and environment
4 to many cities. A number of cities have seen anti-tourism movements protesting against the
5 disruption tourism has created to their lives (Seraphin *et al*, 2018). The complexities and challenges
6 of city tourism, as a source of economic benefits and negative externalities, make it a major agenda
7 for policy makers and planners. The implications to tourism policy and planning in cities are
8 tremendous, so are the opportunities for tourism research in these areas.
9
10

11 Sustainability implications of city tourism have been and will continue to be a major research area,
12 within which there is a need for further investigations on themes such as the circular economy and
13 responsible tourism, both of which have significant policy and planning implications. Overtourism
14 has emerged as a major issue in a number of city destinations, and a number of cities have seen
15 anti-tourism protest movements (Seraphin *et al*, 2018). Population pressure on cities, which could
16 be exacerbated by increasing tourist numbers necessitates further research on carrying capacity of
17 urban destinations within the context of constantly evolving mobility patterns facilitated by
18 technological advancements.
19
20

21 Most of the major city destinations have ethnoscaples (Razak, 2007) making them a kaleidoscope
22 of eclectic cultural spaces, including the diaspora. Ethnoscaples and diaspora tourism thus form part
23 of the policy research agenda for city tourism. Advancements in information and communication
24 technologies have contributed to the emergence of the shared economy, a manifestation which in
25 the accommodation sector (i.e., Airbnb) is said to have exacerbated urban inequality and turning
26 many residential districts in the cities into tourist quarters.
27
28
29
30

31 **Lessons learnt and future challenges from tourism planning in Post-Communist countries**

32
33 *by Assoc. Professor Melanie K. Smith (Budapest Metropolitan University, The Hungarian*
34 *Academy of Sciences and University of Tartu), IJTC Theme Editor for Cultural Tourism and*
35 *Tourism in Post-Communist Countries*
36
37

38 The trajectories of post-socialist cities have not been uniform, nor should they be treated
39 monolithically (Tsenkova, 2012; Berki, 2014; Banaszkiwicz *et al*, 2017). On the other hand, many
40 post-socialist cities share a common history including the challenges of transition. Sýkora (2009)
41 defined the post-socialist city as a temporarily existing, transitional city which adapted to new
42 political and economic conditions in the transformation from communism to capitalism. This
43 includes the development of tourism, which was limited to a great extent before 1989. Several
44 major themes could be said to have emerged within the urban tourism research arena since 1989,
45 including interpretation of the socialist past and dissonant heritage; national and city identity
46 building and branding; cultural and creative industry developments; the role of tourism in urban
47 rehabilitation and gentrification; the night-time economy; and (more recently) 'overtourism'.
48
49
50

51 During the early years after the fall of Communism, the question of national identity construction,
52 image and brand building became important (Andrusz, 2004), an area within which tourism could
53 play a major role. While international tourists were fascinated by the socialist heritage, post-
54 socialist countries and especially their capital cities were keener to present a new identity to the
55 world (Smith and Puczko, 2010a). Socialist heritage often became dissonant, so street and square
56
57
58
59
60

1
2
3 names were changed and the statues of communist leaders were removed or placed in remote statue
4 parks or museums. Instead, of focusing on socialism, new narratives of place identity often invoked
5 an idealised pre-socialist ‘Golden Age’ which was often the late nineteenth century (Young and
6 Light, 2006). Many post-socialist cities are inherently cultural and historic and therefore have
7 always promoted their heritage, museums and galleries (Hughes and Allen, 2005; Smith and
8 Puczko, 2012). Richards (2001) noted that there was a fall in the local consumption of ‘high’
9 culture in many post-socialist countries after 1989, mainly due to a lack of state subsidy and
10 declining incomes. Thus, foreign tourism could provide the boost that was needed for many
11 flagging cultural attractions.
12
13

14
15 Nevertheless, many countries suffered from a total lack of image (Olins, 2004; Smith and Puczko,
16 2010b) and it was often a question of putting themselves on the European and international tourism
17 map. Hall (2004) noted that many visitors harboured images of regional instability, poor service,
18 infrastructure and the low quality of public facilities. However, tourism grew rapidly in the 2000s
19 (Cudny, 2012), in a “desire to make up for lost time” (Banaszkiewicz *et al*, 2017:113). This was
20 further accelerated by EU accession for many post-socialist countries in 2004, after which the
21 advent of budget airlines changed the landscape of tourism quite considerably. By this time, first-
22 time ‘curiosity’ visitor numbers were decreasing (Rätz, 2004), but those interested in enjoying the
23 night-time economy (NTE) and availing themselves of cheap alcohol was increasing. Relatively
24 undesirable forms of tourism emerged in cities like Prague, Krakow and Tallinn, such as ‘stag and
25 hen’ party drinking weekends (Iwanicki *et al*, 2016). Research has started to show that regardless
26 of past developments, post-socialist cities are suffering similar effects of NTE and overtourism to
27 western cities, accompanied by *laissez-faire* attitudes to urban and tourism planning, inconsistent
28 and inadequate legal and regulatory frameworks, and inherent corruption (Tsenkova, 2012; Pixová
29 and Sládek, 2017; Smith *et al*, 2017).
30
31
32
33

34 Future research might attempt to examine the inextricable connection between politics and tourism,
35 especially with regard to changing identity and image construction, and the factors that determined
36 the rapidly changing tourism landscapes from pre- and post-socialist heritage and cultural tourism
37 to NTE-related ‘overtourism’.
38
39
40
41

42 **Looking beyond the negative: Crises in tourism cities as a tool for learning and positive** 43 **change**

44
45 *by Assoc. Professor Joan C. Henderson (Nanyang Technological University), IJTC Theme Editor*
46 *for Tourism Crisis Management for Cities*
47

48 Crises take many forms and are an inescapable aspect of life. In terms of spatial scope, they range
49 from the local to global and can strike at a city level with ramifications for its tourism. National
50 and international crises are often shared by cities where adverse effects may be intensified.
51 Developments in economic, political, socio-cultural and environmental domains separately and
52 sometimes in combination can precipitate crises within an urban context in ways demonstrated by
53 recent occurrences around the world. Major cities and especially capitals are places where financial
54 and political power is concentrated, making them sites for expressions of internal dissent which
55
56
57
58
59
60

1
2
3 can disrupt tourism. Terrorists too are attracted to cities as targets for their attacks because of
4 population densities, capacity for damage and media interest. While tourism crises can be triggered
5 by external factors beyond the control of the industry, they can be induced or exacerbated by
6 industry weaknesses. The popularity of many cities can itself be a source of the crisis, illustrated
7 by mounting resident opposition to what has been labelled 'overtourism'.
8
9

10 City destinations affected by crises face negative publicity, a problem which is aggravated in the
11 era of modern information communication technologies, raising questions about the safety of
12 visitors alongside any tourism industry investment. There are risks that reputations and images will
13 be tarnished, although this depends on the city and nature and duration of the crisis together with
14 the manner in which it is handled by civic authorities and businesses. Tourism has proved its
15 resilience in the past and crisis-stricken destinations have been seen to recover quickly. Recovery
16 and restoration of the status quo, or at least a state of near normality, is aided in the case of larger
17 cities by their size and multi-functionality as centres of business and other types of travel in which
18 there is less discretion than that for leisure purposes.
19
20
21

22 Nevertheless, anticipating and preparing for tourism crises are key responsibilities of metropolitan
23 governments and the commercial sector. Looking ahead, cities confront numerous challenges with
24 the potential to evolve into a situation of crisis which impacts on both domestic and international
25 tourist arrivals. Prospective crises span a spectrum from a single incident to a chronic condition
26 and encompass various sorts such as outbreaks of infectious disease, natural disasters, political and
27 social unrest and financial shocks. Geographical location and stage of economic development play
28 a part in vulnerability to crises and capacity to respond effectively with possible contrasts within
29 and amongst regions worldwide. Crises also represent opportunities for learning and positive
30 change which should not be overlooked.
31
32
33

34 It is therefore instructive to examine city experiences of crises globally with a view to better
35 understand causes and catalysts, evolutionary processes, underlying dynamics and outcomes.
36 Analyses can additionally yield useful insights into good practice regarding tourism crisis planning
37 and management on the part of public and private agencies. There is an appreciation of the
38 significance of urban tourism research generally and the need for further studies (Edwards *et al*,
39 2008; Ashworth and Page, 2011; Pearce and Pearce, 2017). Encouraging work related to issues of
40 crises and dissemination of results is, therefore, an important task for the journal which is of
41 relevance to both academics and practitioners.

46 **On terrorism and its challenges to freedom, mobility and way of life**

47
48 *by Asst. Professor Claudia Seabra (University of Coimbra), IJTC Theme Editor for Terrorism in*
49 *Tourism Cities*
50

51 Terrorism is becoming frighteningly frequent. Recently, several countries have been targeted by
52 terrorist attacks that are shaking important foundations upon which our identity is based: freedom,
53 mobility, culture fruition and a happy way of life. The recent terrorist events mainly targeting
54 important tourist sites and cities, beaches, museums, resorts, airports, train and subway stations,
55 restaurants, discos, festivals, prove the high value of tourists as terrorist targets. Too many attacks
56
57
58
59
60

1
2
3 targeted people who just wanted to be happy and have fun, working, living and travelling freely
4 around the world...
5

6 These events marked the beginning of a new unsafety environment. The positions are radicalized;
7 the discourses are hard and proactive. Many countries are preparing measures to strengthen security
8 modifying its legislation to prevent further attacks especially in limiting the entries and visas. Some
9 voices arise, asking for changes to the free movement of people especially in border controls
10 limiting travelling. How do these attacks on freedom, mobility and way of life, condemned by all,
11 manage to create, in turn, limitations to those same freedoms and way of life? There is a constant
12 state of alertness that forces us to be in a constant state of discomfort that is almost comfortable. In
13 turn, terrorism is having a strong impact on travel patterns. Tourists are avoiding destinations that
14 experienced terrorist attacks changing the geography of travel. This reality is bringing to
15 destinations and tourism firms new challenges to manage the damages caused by this unsafety
16 environment. This daily contact with terrorism makes it strangely close and almost tolerable. It is
17 urgent to understand this phenomenon. Hence, safety is one of the most fundamental conditions
18 granted to human beings, it is an anthropological need and a vital part of the human condition. New
19 research agendas should help to understand the real effects of terrorism on the individuals' life, to
20 address both the material and the psychological cost of terrorism in the people's behaviour, namely
21 in what regards to peoples' movement and travel.
22
23
24
25

26 **Resetting and re-exploring the foundations of tourists' behaviour in tourism cities**

27
28 *by Professor Philip Pearce (James Cook University), IJTC Theme Editor for Tourist Behaviour*
29 *in Cities*
30

31
32 There are many themes about tourist behaviour which can be extended and revisited in future
33 research about tourism cities. Four topics can be highlighted – wayfinding, dealing with others,
34 appraising satisfaction, and storytelling. They all stand out as areas of particular interest. The need
35 to refresh older studies exists because technology has reshaped some of what tourists have to do to
36 cope with city visits. Further, new numbers and waves of tourist popularity in many cities present
37 challenges which are unlike those seen in twentieth-century foundation studies. These changes
38 demand that researchers build and regenerate what we know for the coming decade.
39
40

41
42 Wayfinding studies were built on tourists use of hand-held maps and followed the pioneering work
43 of Lynch (1960). These early studies provided a coding system and interesting ideas about how to
44 design maps for tourists. They partly answered questions about why men and women approach the
45 task of mapping the city differently and avoid getting lost (not always successfully). With mobile
46 phones, satellite technology and the use of advisory directional aids, the support systems for finding
47 the way in a city are markedly different. Nevertheless, how individuals negotiate, use and argue
48 over the right turns to take or the most desirable option to visit still matter and are worth studying
49 - both for the harmony of the travel party and for the businesses seeking to attract their customers.
50

51
52 Dealing with others in city tourism has become the hot topic of this decade. Tourists have to deal
53 with the problem of overtourism, at least for the duration of their visit. Local citizens, of course,
54 have to deal with the problem over several months, and sometimes for almost twelve months of the
55 year. Our models of tourist-tourist and tourist-local contact were built in less busy times (cf. Amir,
56
57
58
59
60

1
2
3 1969; Hottola, 2005). The extent to which tourists annoy one another and frustrate the local
4 community may have to be reconceptualised with new social representations of the problem of
5 crowding and stresses on human and physical resources. Significant shifts in how city tourist
6 experiences are redesigned to account for the large volumes of people represents a conceptually
7 interesting challenge with important applied consequences.
8
9

10 Satisfaction, like the other foundation concepts considered here, was initially emphasised in
11 consumer studies in the 1950s. By the time the Rolling Stones sang about the topic in the 1960s, it
12 was an entrenched dependent variable in business and marketing. As shifts in the economy
13 developed towards the end of the decade, the foundation idea that satisfaction was all that mattered
14 in evaluating tourist behaviour was wearing thin; other outcomes such as learning, self-
15 development, personal growth, and having a low impact started to appeal as alternative measures
16 of the worth of the holiday. In looking forward, the need to embrace a wider range of outcomes to
17 assess the meaning of city trips is now on the agenda of contemporary researchers and links to
18 motivation theories, such as my own travel career pattern (Pearce, 2005; 2011), may suggest more
19 factors to consider when reviewing the benefits of a city holiday.
20
21
22

23 Telling one's travel story has also changed over the last 50 years. When tourism studies started to
24 blossom, there were not so many travellers and certainly relaying messages about international and
25 domestic holidays was a snail mail process. On return to one's home community, the full events of
26 the holiday and its sights and sounds were relayed to audiences for the first time. Now in the social
27 media world, and with the greater numbers of experienced travellers, it is much harder for the
28 returning tourist to have something novel to say. Many struggle to avoid repeating the themes
29 already broadcast through Facebook, WeChat or Twitter. In essence, tourists have to work harder
30 to exploit social status and personal gain once easily acquired by travelling to a city. There is
31 research to be done, therefore, on what are the best city tourism stories, and importantly, how can
32 an understanding of these stories, translate into marketing and business opportunities for
33 destination marketers.
34
35
36

37 City tourism has deep roots in many cultures and societies. Pathways to study aspects of tourists'
38 behaviour were set when tourism flourished in the second half of the twentieth century. It is
39 desirable now to reset and re-explore some of these foundation directions for the next decade.
40
41
42

43 **Research into business tourism: past, present and future**

44
45 *by Dr Rob Davidson (MICE Knowledge and University of Greenwich), IJTC Theme Editor for*
46 *Meetings, Incentives, Conferences and Exhibitions (MICE)*
47
48

49 A significant proportion of the visitors to cities around the world are business tourists – people
50 attending meetings, conferences, trade shows and other types of events connected with their
51 employment or economic activity. This form of tourism brings a range of benefits to cities,
52 principally economic, as the daily expenditure of business tourists is generally much higher than
53 that of leisure visitors. For example, in 2017 the daily expenditure of international business visitors
54 to Australian cities was almost double that of holiday visitors to those destinations in the same
55
56
57
58
59
60

1
2
3 year. In addition, for most cities, business tourism is far less seasonally-concentrated than leisure
4 tourism, decreasing in volume only at holiday periods and weekends.
5

6 In recognition of business tourism's potential to create additional profits for local hospitality
7 businesses and employment for their citizens, a growing number of cities around the world have
8 developed their infrastructure for this segment of the tourist market, constructing conference
9 centres and exhibition halls in which business events may be held. The private sector has responded
10 in a similar manner, with the opening of new convention hotels in destinations worldwide. This
11 physical infrastructure has been widely complemented by the building of a human infrastructure
12 for business tourism, comprising Convention Bureaux and other destination marketing
13 organisations with the explicit role of attracting large-scale business events to their cities.
14
15

16
17 Although research into business tourism often appears to pale into significance by comparison with
18 the volume of research into leisure tourism, there has been a recent increase in both the quantity
19 and quality of academic research focusing on this topic. But this growth has been slow in coming.
20 In one of the first reviews of academic research into business events, Yoo and Weber (2005)
21 declared that, despite strong growth in flows of global business tourism over the previous quarter
22 century, it remained under-represented in tourism scholarship as a whole. Five years later, Stetic
23 and Simicevic (2010) still considered that business tourism had not attracted the attention of a
24 number of researchers that was commensurate with its economic importance. But Mair's (2012)
25 review of the academic business tourism literature from 2000–2009 suggested that interest in this
26 form of tourism was increasing, with researchers focusing largely upon the economic impact of
27 business tourism and the site selection process of conference organisers. Her review identified
28 further areas which have been the focus of considerable research efforts in the period 2000–2009.
29 These include the evaluation of satisfaction by meeting planners, the role of destination image in
30 conference attendance and the decision-making process of conference attendees. But perhaps the
31 most valuable contribution of Mair's review was her highlighting of important research gaps. She
32 identified these as the social and environmental impacts of business events; climate change and
33 events; incentive travel; and qualitative research (into, for example, the meanings that individuals
34 attach to business events, or about their experience of attending a business event).
35
36
37
38
39

40 It is perhaps the last of these that offer the greatest potential for providing useful insights into the
41 crucial demand-side factors in the business tourism market, as opposed to the more quantitative
42 supply-side research that has dominated this field of enquiry until recently. We need to achieve a
43 much better understanding of business tourists' experience of visiting our cities and their journeys
44 through those experiences, from the initial invitation to attend a business event to departing from
45 the destination when that event ends. For example, we need a greater understanding of topics such
46 as: What role does destination image play in the potential business tourist's decision of whether or
47 not to accept the invitation? How does the experience of business tourists differ from that of leisure
48 visitors to cities? What are the factors that come into play in the business tourist's decision on
49 whether or not to extend their business trip for leisure purposes by spending a few extra days in the
50 city? These, I believe, will be among the themes that will increasingly attract the interest of
51 researchers over the next few years.

The need for different approaches to understanding special interest tourism in the urban context

by Professor Cina Van Zyl (University of South Africa), IJTC Theme Editor for Special Interest Tourism

Tourism, along with other key pillars, constitutes a central component in the economy, social life and the geography of many cities in the world and is thus a key element in urban development policies. Urban tourism can represent a driving force in the development of many cities and countries; tourism is intrinsically linked to how a city develops itself and provides more and better living conditions to its residents and visitors (UNWTO, 2018a). This is more particularly valid for Special Interest Tourism (hereinafter SIT).

The developments during the current decade point out a shift of tourism in focus towards innovation and experiences, and tourists' demand for diverse and immediate experiences in cities (UNWTO, 2018b). The various forms of SIT – heritage, cultural, events, culinary/gastronomic, etc. - constitute, in our humble opinion, the mainstream of these experiences. This context involves an imperative to improve our understanding and knowledge of the various factors influencing tourism in cities and the related challenges.

A better understanding is needed, and this is the role of academic research. Researchers should aim at exploring and gaining insights on the various issues of the topic of SIT in the urban context and settings. Academic research – conceptual approaches and empirical studies - should investigate the issues and aspects related to SIT from the perspective of different disciplines, i.e. psychology, anthropology, sociology, economy, marketing and management. Some suggestions for future research, classified into four perspectives or streams, are formulated below.

On management in tourism cities: understand and manage visitor growth and emerging challenges; visitor management challenges in urban contexts; adequate strategies and actions plans to manage tourism in urban destinations to the benefit of visitors and residents alike; ensure sustainable policies and practices that minimize adverse effects of tourism on the use of natural resources, infrastructure, mobility and congestion, as well as its socio-cultural impact; appropriate governance models to address the challenges facing urban tourism; collaboration and cooperation approaches in fulfilling tourism's potential (based on stakeholder theory); approaches and strategies to build shared responsibility amongst stakeholders directly or indirectly involved in urban tourism for sustainable development.

On-demand/tourist consumers: the antecedents/motivations for and the influencing factors of consumers of SIT; the encounter between hosts and guests and their interaction in cities; the exchange value consumption in psychological, and anthropological terms; creating innovative experiences, experiences design and development; the factors influencing the consumers' perceived value and satisfaction of experiential services (assessment); comparative approach and investigation to conventional forms of tourism; and Millennials vs Generation Z (similarities and differences).

1
2
3 On supply and business perspective: interesting avenues for future research include issues such as
4 the impact and contribution of SIT to entrepreneurship; from marketing management perspective
5 the business models of SIT (critical success factors as well as their marketing strategies); the
6 strategies adopted and implemented by businesses in providing high quality experiences as well as
7 quality of tourists' experiences determined by sustainability, accessibility, connectivity, and
8 infrastructure.
9

10
11 On hosting community/urban area: academic research should explore the perceptions of local
12 populations and their level of satisfaction, analysis of residents' perceptions towards SIT in cities;
13 the effects of SIT on cities and local populations such as the perceptions of residents and the
14 conflicts among different stakeholders; the economic effects/impact on hosting cities (local
15 economy); as well as the contribution of SIT in job creation and employment by local tourism
16 businesses; (and strategies and approaches in involving all stakeholders, bringing residents and
17 visitors together and adopting careful planning which respects the limits of capacity and the
18 specificities of each urban destination.

23 **Conservation of 'nature in the city' and its importance for city tourism**

24
25 *by Assoc. Professor David Newsome (Murdoch University), IJTC Theme Editor for Ecotourism*
26 *and Liveable Cities, and James Hardcastle (International Union for Conservation of Nature –*
27 *IUCN, Switzerland)*
28
29

30 Natural vegetation, greenspace comprising parks, water features and native trees, and associated
31 wildlife (particularly birds) are increasingly important as recreational resources for urban people
32 who are in the pursuit of healthy lifestyles and hobbies, and for those who are promoting green
33 aspects of city tourism. 'Nature in the city' and the emerging importance of natural areas in 'city
34 liveability' was raised in the first issue of the *International Journal of Tourism Cities* (Jones and
35 Newsome, 2015). In recent years, the importance of nature in cities has been highlighted according
36 to the health benefits for resident populations (Bratman *et al*, 2012; Shanahan *et al*, 2015), social
37 and psychological benefits (Gladwell *et al*, 2013) and in regard to the conservation of urban nature
38 (Müller and Werner, 2010). However, as posited by Jones and Newsome (2015), emphasising the
39 importance of natural areas in urban environments, in regard to city liveability and tourism
40 potential, still requires further attention and recognition. We believe that the next phase in exploring
41 the context of nature in the city is in regard to acknowledging and extending the views forwarded
42 by recent research (Dallimer *et al*, 2012; Keninger *et al*, 2013; Taylor and Hochuli, 2015) and
43 setting this in the context of internationally recognised standards and criteria for the conservation
44 of important natural and cultural values, such as the IUCN Green List (IUCN, 2018; Wells *et al*,
45 2016).
46
47
48
49
50

51 Although many cities feature environmental highlights a few offer natural values as part of a 'top
52 ten' list of tourist attractions. A brief Trip Advisor search for some representatives of the world's
53 most populous cities, 'city proper' shows that very few of them feature even one 'natural' area or
54 attraction within the top 10 things to do within or nearby city limits yet, at the same time, they
55 collectively include more than 175 million people. For example, cities such as London, Tokyo,
56
57
58
59
60

1
2
3 Beijing and Istanbul receive millions of visitors per year. Providing nature-based tourism and
4 recreational experiences within cities have incredible health, education and well-being benefits for
5 people and communities and urban societies alike.
6

7 In addition, providing local natural attractions can help reduce the 'export' of tourists seeking
8 experiences in other places, provide benefits for locals and add value for travellers who are
9 interested in reducing their global carbon footprint from tourism (McKercher *et al*, 2010; Juvan
10 and Dolnicar, 2014).
11

12
13 In addition, urban protected areas are generally viewed as a low priority for biodiversity
14 conservation (Watson *et al*, 2014), and subsequently, do not yet receive the attention and support
15 of some international nature conservation groups. Yet such natural areas can help to foster city
16 liveability and serve as tourist attractions in their own right (Jones and Newsome, 2015). However,
17 the situation is changing. For example, the IUCN maintains an urban protected areas specialist
18 group within the World Commission on Protected Areas (WCPA), IUCN resolutions call for more
19 focus on 'healthy parks, healthy people' and emphasise the role of protected areas in providing
20 ecosystem-based disaster risk reduction. Moreover, ecosystem services such as clean air and water
21 are increasingly recognised to play a vital role in adaptation to climate change in and around cities.
22 There is also a World Bank-led programme on resilient cities and campaigns to foster greener cities,
23 such as the 'London National Park' campaign (London National Park City, n.d.).
24
25
26

27 Protected areas in cities such as areas with a defined nature conservation value, i.e. species, habitat,
28 ecosystem services, biodiversity and educational/cultural values linked to nature, are increasingly
29 being recognised as important for conservation. In some cases, 'natural areas' in cities are being
30 restored and actively managed, or even created (Ikin *et al*, 2015; Simpson and Newsome, 2017).
31
32

33 Moreover, it is important to appreciate that the collective success of conserved areas in cities
34 depends on an overall plan and integration at the landscape scale (Antognelli and Vizzari, 2017).
35 IUCN's new Green List sustainability standard (IUCN, 2018) could help frame success for urban
36 conservation areas and provide an incentive for dedicated investment into master-planning, and in
37 achieving and maintaining good performance at sites within cities and across clusters of 'sites'
38 sharing similar values.
39
40

41 Research opportunities include the development of standard indicators for the conservation of
42 nature in cities, a specific focus for indicators on visitation, education, access and equity, and on
43 good governance and management that helps expand and connect natural values across a cityscape
44 and landscape. In this regard, IUCN Green List expert evaluators include urban experts. Managers
45 of natural sites in cities could be encouraged to jointly apply for the IUCN Green List where they
46 share natural values, or where conservation outcomes are dependent on collective performance and
47 good management. Such international standards will foster urban tourism and additionally lead to
48 city reserves and other green spaces becoming features of city tourism to be valued and marketed
49 in their own right. Such activities are likely to further enhance the tourism value of existing nature
50 spaces in cities such as Xi Xi Wetland, Hangzhou, China; Son Tra Peninsular in Da Nang, Viet
51 Nam; Kings Park in Perth, Australia and Central Park in New York, USA.

In conclusion: Opening new research avenues with visual research methodologies

by Dr Tijana Rakić (University of Brighton), IJTC Theme Editor for Visual Research Methodologies

Although visual methodologies are still on the methodological margins of tourism studies (Rakić and Chambers, 2012a), the past decade has witnessed the significant proliferation of a variety of visual approaches to research among tourism scholars. Visual methods are not only increasingly perceived as valid and legitimate methods, but also as methods which can enable the production of knowledge on previously relatively under-researched themes.

Visual methodologies offer numerous opportunities for research on tourism cities in that visual approaches to research can, for example, enable scholars to collect and analyse a variety of materials containing (audio)visual representations of a destination. Examples of such materials include tourist photographs or videos, promotional materials, brochures, postcards, news reports and articles, films, TV-Series, documentaries, animations, travel vlogs and blogs. The importance of sourcing and analysing these materials through analytical approaches such as discourse, narrative, content or semiotic analyses lies in the fact that these materials project, and inevitably also partly inform, the image of a destination.

In addition, numerous possibilities for research on tourism cities are also afforded by elicitation techniques and researcher- or research participant-produced visuals (Rakić and Chambers, 2012b). Importantly, fieldwork methods such as (audio)visually recorded sessions of participant observation and interviews can also enable researchers to produce visual research outputs such as a photographic exhibition, a video or an academic documentary (see Rakić and Chambers, 2010; Rakić, 2010), assisting researchers to inspire further discussions about their project, its findings and implications among the wider public, policymakers or stakeholders of tourism development at a destination.

Given the importance of the visual imagination of a destination prior to visitation, the importance of visually recording (and in some cases live streaming) the tourist experience while at a destination, and the role of the visuals such as photographs and videos in remembering and narrating the tourist experience, visual methodologies are likely to be at the heart of research on tourist cities in the future.
